

ABSTRACT

The thickness of a case can be changed.

Therefore, in this case, two frame members, each molded into a square shape, using a plastics material, are connected together by hinge pins 12 so as to be opened and closed, and each shell is molded into a dish-like shape, using a plastics material, and a peripheral edge portion of the shell is turned back outwardly into a U-shape. A groove is formed in a peripheral portion of the frame member, and when the shell is fitted into the frame member, the turned-back portion of the shell is snugly fitted in the groove in the frame member.
